

Fidelity Investments

About Fidelity Investments

Fidelity Investments was founded in **1946** by Edward C. Johnson II and is headquartered in **Boston, USA**. It began as a small investment firm and has grown into one of the world's largest financial services companies. Fidelity offers services like mutual funds, retirement planning, and wealth management. The company is known for its focus on technology, customer service, and helping investors achieve long-term financial goals. It serves millions of clients across the globe.

Number of rounds

1. Online Test
2. Technical Round
3. HR Round

Round 1: Online Test

The online assessment was conducted on the **HirePro Platform** and lasted for about **1 hour and 30 minutes**. It consisted of **3 sections**, each with a time limit.

1. **Section 1 – English Language and Verbal Ability**

Included questions on Sentence Arrangement, Fill in the Blanks, and other grammar-based exercises.

2. **Section 2 – Technical Aptitude**

Covered core CS topics such as Data Structures & Algorithms (Sorting, Graphs, Heaps), Database Management Systems (SQL queries), Object-Oriented Programming, Networking, and output-based coding problems. It also included basic-level questions on Prompt Engineering and Generative AI. The difficulty ranged from easy to medium.

3. **Section 3 – Coding Questions (Easy Level)**

The section had two programming problems focused on arrays and strings:

- **Problem 1 – Transform a String by Custom Shifting**

Read a string of lowercase letters and shift even-indexed characters two steps forward and odd-indexed characters one step backward in the alphabet (with wraparound).

Example: Input: abcdef → Output: caeceg

- **Problem 2 – Product of Digit Sums with Digital Root**

Read two integers, compute the sum of digits of each, reduce them to a single-digit number if necessary, and print the product of those sums.

Example: Input: 58 97 → Output: 28

4. Outcome

A total of **75 students** were shortlisted for the next round.

Round 2: Technical Interview

The **Technical Interview** was conducted at **CUIC** at **9:00 AM**. The session began with a brief introduction to the company, highlighting its services, values, and areas of expertise.

The interviewer first asked, “What question do you expect first?” I replied “Introduction,” and was then invited to proceed. I gave a brief introduction about myself, covering my background and interests.

The interviewer then reviewed my resume and asked questions related to the technologies and skills I had listed. I answered the questions confidently and explained my experience. He further asked about real-world applications of data structures, including:

- **Where arrays are used in real life:** I explained examples such as storing student records, managing inventory in e-commerce platforms, and handling images in computer graphics.
- **Which data structure is used in a railway ticket booking system:** I explained that structures like queues and linked lists are commonly used to manage bookings, reservations, and waiting lists efficiently.
- The interviewer asked which programming language I prefer, and I replied **C++**. He mentioned that he was interested in **Java**, and I responded that I am comfortable working with Java as well and can easily

switch if required. He then asked a few output-based technical questions in java (try catch exception) which I was able to answer correctly.

- The interviewer also asked about **compile-time and run-time errors** by writing a small piece of code and requesting me to identify whether it would produce a compile-time or run-time error, and to explain why. I provided the correct explanation.
- Additionally, he asked questions on key programming concepts such as **abstraction, inheritance**, and other object-oriented principles, to which I answered confidently.
- After that, he asked me to explain a project I liked the most. I briefly described the project, the technologies I used, how it was implemented, the challenges I faced during development, and the steps I took to overcome those issues.
- After discussing the project, the interviewer asked, **“Why Fidelity?”** This question aimed to understand my motivation and interest in joining the organization.
- At the end of the interview, the interviewer asked if I had any questions. I inquired about his experience at the company and the types of projects interns would work on. The interview session lasted for **45 minutes**.

Round 3: HR Interview

After the technical round, I was called for the HR Interview within 5 minutes. The session began with the interviewer introducing himself and asking about my personal background, including:

- Family details
- Hobbies and interests
- Academic performance, specifically my percentage in 12th standard

He asked why I chose to apply to Fidelity and inquired about my knowledge of mutual funds. I explained what I knew, and he provided further details about mutual funds and their workings.

The interviewer also asked about software development methodologies and reviewed my project, asking why I chose that particular project and how I managed team collaboration during its development.

Furthermore, he asked about my strengths and how I would handle a situation if a teammate was unable to contribute to the project. I responded

positively, explaining how I would adapt, support the team, and ensure the project's progress

The HR interview lasted for 30 minutes. Afterward, around 25 to 30 students awaited the results.

Finally, **12 students were selected** for the internship, and I was delighted to be one of them.

Key Takeaways:

- Follow structured preparation resources like the Strivers Sheet.
- Build a strong foundation in basics of programming and computer science.
- Always have clear knowledge of data structures, how they are used in code, and their real-world applications.
- If you do not know the answer, start with a brute-force approach and gradually optimize.
- Do not hesitate to ask questions or clarify doubts during interviews.
- Maintain confidence and a positive attitude throughout the process.

Resources and Preparation Tips:

Focus on one language and practice problem-solving regularly on platforms like LeetCode, HackerRank.

Be ready to explain your projects end-to-end, as technical questions often revolve around them.

Platforms like GeeksforGeeks and LeetCode are excellent for quick revisions and brushing up on key concepts.

Understand the company's background and prepare meaningful questions to ask the interviewer

Always be truthful about the skills and experiences listed in your resume. Be prepared to explain every point in detail, providing examples wherever possible to demonstrate your understanding and experience.

Be well-prepared in **OOPs, DBMS**, and also cover important topics from **Operating Systems** and **Computer Networks**.

ALL THE BEST!!!

If you have any doubts or need further clarification, **feel free to reach out to me**.
