

FIDELITY INVESTMENTS

About the company:

Fidelity Investments is one of the largest and most well-known financial services companies in the world. Founded in 1946, Fidelity has grown to become a prominent player in the investment and asset management industry. Headquartered in Boston, Massachusetts, the company offers a wide range of financial products and services to individual investors, institutions, and employers.

Number of rounds:

The recruitment process consisted of 3 rounds:

1. Online Test
2. Technical Round
3. HR Round

Details about the rounds:

Round 1: Online Test (04/09/2023)

The online test consisted of MCQs based on English, technical MCQs, 2 coding questions of easy-medium difficulty, and 2 questions for which we were expected to write algorithms for. The test happened on the hirepro platform. Since the test happened around 20 days before the actual interview, I couldn't recollect any of the questions that were asked, or the test duration. But here's one of the coding questions:

Given a pattern with missing digits, for example 1_2_5 (where '_' indicates missing digits), fill the missing digits in such a way that, the resulting number is the largest possible perfect square that can be formed from the given pattern. I used a brute force solution to solve this.

The other coding question was way easier than this.

Round 2: Technical Interview (27/09/2023)

24 people were shortlisted for the interviews, and I was one among them.

Firstly, the interviewer asked me to introduce myself. I gave a short intro on my academic background and highlighted my strengths. Then she asked me to explain about the most recent project I have worked on. Since that was based on DBMS, I gave an overview about the project. After that she asked some questions like what kind of database and data structures does Google search engine use. Along with the reply to this question, I added that Google uses AI to recommend search results based on previous search queries. She then asked me what knowledge I have in AI/ML. I started explaining in detail about the two ML projects that I had

mentioned in my resume. After a few other brief questions like about my hobbies, the interview was over.

I asked her a couple of questions, one was about her journey in Fidelity Investments, and the other was about the roles and responsibilities of an intern at the company. (Note: Do not forget to ask about the interviewer in case they don't introduce themselves)

Overall, the interview went smoothly and it was very comfortable talking with her. This round went on for 15-20 minutes and I was called for the HR round immediately.

Round 3: HR interview (27/09/2023)

Here again, I gave the same introduction about myself. The interviewer started off by introducing herself and asked me what I have been doing apart from academics at CEG. I explained to her about my roles in ACM-CEG and CTF. I also explained what kind of work I had done till then in those clubs. She actually wanted to know whether I had done any kind of certifications. I had completed the German course conducted on campus, so I mentioned that. I also said that I was planning to do a certification course in Professional Communication.

She then asked me about what I knew about fidelity investments. Since I had done minimal research, I was not able to tackle the question confidently. She then explained what the company primarily does. She immediately followed up by asking, "What do you think an individual with a CS background would do in a company like this?". After this and a few other questions, the interview got over.

I asked her about the work culture in the company and feedback on how I performed in the interview. This round went on for 10-15 minutes.

6 people were finally selected for the internship, and I was one among them.

Key points to note:

- Always be truthful to your resume.
- Do a thorough research about the company before attending the interview.
- Be thorough with the projects you mention in your resume from head to tail, and be ready for follow-up questions.
- Practice coding in any of the available coding platforms (Leetcode, Hackerrank, etc.)
- Concentrate on time management while attending Online tests.
- Be thorough with DBMS, OS and DSA. Also try to concentrate on OOPS and Networks.

All the best !
