

BNY MELLON TECHNOLOGY (Internship)

About the Company

The Bank of New York Mellon Corporation, commonly known as **BNY Mellon**, is an American multinational Investment banking services holding company headquartered in New York City. It is by far the world's largest custodian bank and asset servicing company. BNY Mellon is an investments company, which provides investment management, investment services and wealth management helping institutions and individuals succeed in markets all over the world.

Online Round (Coding)

Alike all the companies, Coding round was the BNY Mellon's first level of selection process. There were 4 coding questions distributed across various domains and rated under different difficulty levels. The platform used was hackerank. Out of these 4 questions, one was categorised as easy, two were medium and one was hard. The easy question was plain sailing and was based on arrays. But the challenging part of this question is to handle the given constraints where without handling it may cause 1 or 2 testcases to fail.

Both the medium questions were based on strings. These were little bit tricky but could be solved with thorough knowledge over the fundamentals in strings and suffice amount of time. The hard question was a back-tracking problem. Candidates who solved atleast 2 questions were shortlisted for the next round. Around 20 pupil cleared this round.

Technical Interviews

There were 2 technical interviews in total. In the first round, initially I was asked to introduce myself briefly and then was tested on my basic understanding of datastructures. Along with this, I was asked to write small code snippets which was mostly on arrays and recursion. Also, I was given a situation based question and was questioned on how could I cope-up with the given situation. Based on the performance, almost half of the candidates were shortlisted for the next round of interview. I was one among them.

In the second technical round, the questions were fully focussed on my resume. I detailly explained all the projects which I worked on when I was asked to do. Also, I was asked to write some of the code snippets for the projects I

explained. Some questions were on computer networks, DBMS and data structures. Given a problem, I was asked to solve it. It was mostly on strings and arrays. Approximately 10 candidates including me who attended the round 2 was selected for the next round.

In the round 3, questions on pointers, DBMS and operating systems were the centre of attention. Resume specific questions were also asked. We also talked about the extra courses and projects which I was undertaking. The final list of the selected candidates were shared after the end of the last round.

Internship Experience:

Due to the current pandemic situation, the internship was held virtually for 3 months from May 2020 to July 2020. Initially we had a week of training where we were introduced to company's tradition and technologies used. Then, we were put in different teams working under various domains and were assigned a mentor. I worked on various enterprise applications which were coded in JAVA and also on the security vulnerabilities. In a nutshell, my internship has been an excellent and rewarding experience. Not only I did gain practical knowledge but also got an opportunity to meet many new technically expertise people. Also, there was enough flexibility and time for me to learn and to try out my own ideas.

Topics to be focussed: Data structures, Algorithms, Networks, DBMS

All The Best!!!
