

Intern Drive Experience – Accenture

Manish M (IT Purple)

About the company:

Accenture is a global professional services company offering services in strategy, consulting, digital, technology, and operations. It helps businesses improve performance and navigate change through technology and industry expertise. Accenture has a notable presence in India and across the globe, working in areas such as digital transformation, cloud, and AI to assist businesses in their growth.

Role: Advanced Application Engineering Intern

Round 1 – Cognitive and Technical Assessment:

The test consisted of 90 questions to be completed in 90 minutes. It was divided into six sections covering topics like verbal, aptitude, reasoning, pseudocode outputs, MS Office, and basics of networking and cloud.

Those who cleared the test proceeded to the coding assessment, which took place immediately afterwards.

Round 2 – Coding Assessment:

There were two coding questions, and 45 minutes were provided. Both the questions were fairly straightforward and involved arrays and sorting for me. One thing to note is that you had to handle both the input and output yourself, rather than just filling in a function as in typical tests. Those who are unfamiliar with this can find similar questions on platforms like CodeChef and Codeforces.

68 students were shortlisted after this round.

Round 3 – Communication Assessment:

The test took about half an hour and was AI-based. It assessed reading, listening, and speaking skills through tasks such as reading sentences aloud, repeating phrases, and retelling a narrated story.

This was not an elimination round.

Round 4 – Virtual Interview:

The interview was held online on Accenture's platform and was 25-30 minutes long. My interview was not too technical, focusing instead on general and behavioural questions. The interviewer concentrated on my projects, discussing the experiences and skills gained while working on them. Apart from that, there were questions about academics, as well as some HR-related ones.

Five students were shortlisted for the internship.

Preparation Tips:

- Keep Leetcodeing and keep strengthening your DSA.
- Build a strong resume, highlighting projects, certifications, achievements, and anything else that adds value.
- Focus on projects and explore trending areas like AI and machine learning.
- For coding rounds, practice a wide range of problems and participate in contests across various platforms.
- For interviews, first and foremost, ensure you have a strong resume with solid projects. Be thorough with each of your projects and prepare to answer any questions about them. Be well-versed in OS, DBMS, OOP, SQL. and have strong communication skills. Prepare for frequently asked questions and go through past interview questions and experiences.

ALL THE BEST ;)
