

PLACEMENT EXPERIENCE – APPIAN

NAME: HEMACHANDAR K (2022115092) - Product Engineer Role

ABOUT THE COMPANY:

Appian is a software company that automates business processes. The Appian AI-Powered Process Platform includes everything you need to design, automate, and optimize even the most complex processes, from start to finish. They have office locations all over the world and in Chennai in India.

PROFILE:

The first important thing is your **resume**, where you will list all your projects, internship experiences, and the experiences you have gained from various clubs in our college. Make sure everything is clear and organized, and present each valid point in a separate section.

Personally, I developed my resume from scratch, ensuring that it included the most important sections — **Experience** and **Projects**. These two are essential, along with your **Skills**, such as the programming languages you know.

One important tip: interviewers will not usually ask questions on every skill you list, but they will definitely ask which language you are strongest in. So, make yourself strong in one particular language and have a proper, complete understanding of it.

In addition, make sure you have solid foundational knowledge in all core computer science subjects, such as **Computer Networks**, **DBMS**, and **Operating Systems**. Aim for an in-depth understanding of these concepts.

Maintain a clean and clear resume. Don't exaggerate or include things you don't know. Include all your projects and experiences — don't leave anything relevant out. Present your information in bullet points for clarity. Always fill the key sections: **Experience**, **Projects**, and **Skills**, as these are the most important parts of your resume

CODING ROUND:

In the coding round, they asked DSA questions. One of the questions was the **Josephus problem**. I think this question was also asked in the previous year, so make sure to go through it thoroughly, it's a commonly repeated question.

Another question was based on the **sliding window** approach. Unfortunately, I can't recall the other two problems, but there were a total of around four DSA problems. You need to solve all four in the first coding round.

TECHNICAL INTERVIEW :

The first technical interview was conducted **in person** and lasted around **one hour** for me. The interview started with **puzzles** — the interviewer gave me two puzzles.

The first puzzle was: *You have to make three slices on a cake, but with those three slices, you should get a total of eight pieces.*

After the puzzles, the interview moved to **DSA questions**. I was asked around three DSA problems:

1. **Power Station Problem** – There are N power stations to be implemented around the city. For each power station, a specific **cost** and **reward** are given, along with a total budget. The task is to choose which power stations to implement so that the **total cost** is less than or equal to the budget, while **maximizing the total reward**.
2. **Missing Number Problem** – You are given an array containing numbers from 0 to N in any order, but one number is missing. You need to find the missing number.
3. Sorry, I couldn't recall the third question.

Apart from the DSA questions, they also asked several questions on **DBMS** and **OOP concepts**. They further discussed my **internship experience** in detail.

That's how the first technical round went for me.

BEHAVIOURAL ROUND 2:

The second round was a **behavioural round**, conducted in **virtual mode**. It lasted around **10 to 15 minutes**.

They mainly asked questions about my **projects** and **resume**. I was asked to explain my most recent project in detail. They also asked about the **role** I had applied for — specifically, *"What do you know about the role?"* and *"What do you know about the company?"*

HR ROUND:

The final **HR round** involved questions about my **personal details**. They then explained the **role** and provided information about the **company** and what they do. This round was brief, lasting around **5 to 10 minutes**.

PREPARATION STRATEGY:

For the **DSA preparation strategy**, just follow **Striver's A to Z DSA course**. For studying concepts, you can get the materials from our **department resources** — that's where I got all my resources, and I studied from those only.

For coding practice, apart from Striver's material, try solving additional problems related to the company you are applying for.

For **computer science concepts**, you can refer to our **department placement materials**. You can also refer to **GeeksforGeeks** for studying these concepts.

Feel free to reach me if you need any help or have more questions at 8778624248.

ALL THE BEST!
