

PLACEMENT EXPERIENCE – APPIAN

NAME: MOWNIYA THANGARAJ

ABOUT THE COMPANY:

Appian is a software company that automates business processes. The Appian AI-Powered Process Platform includes everything you need to design, automate, and optimize even the most complex processes, from start to finish. They have offices all over the world and in Chennai, India.

CANDIDATE PROFILE:

Before my campus placements began, I had the opportunity to attend internship interviews for **Vegrow** and **Barclays**. These experiences boosted my confidence and gave me good exposure to handling both technical and behavioural questions in a formal interview setting.

For Appian, I applied for the **Product Engineer** role, which was a new role introduced by the company. I had a keen interest in working in this domain, and my previous interview experience helped me stay confident and composed throughout the process.

As for my resume, I made sure it was concise (one page), well-structured, and highlighted my projects, skills, and achievements clearly. I included only those technologies and skills I was confident about, as I knew interviewers would deep dive into them.

PRELIMINARY ROUND:

The online assessment had 4 coding questions. I was able to fully solve 3 questions and partially solve 1.

My problem-solving skills and ability to write clean, optimized Java code helped me get shortlisted for the interviews.

INTERVIEW ROUNDS:

ROUND 1 – Technical Interview (1 Hour)

- This was a detailed technical discussion focusing primarily on my **projects** and **resume**.
- I was asked to **draw the complete architectural diagram** and **ER diagram** of one of my key projects.
- The interviewer explored **each and every technology** mentioned in my resume, asking me to explain its use and how it fit into the overall project.

- Finally, I was given **one DSA problem**, which I solved after explaining my thought process and handling edge cases.

ROUND 2 – behavioural Interview

- The questions revolved around my motivation for choosing the **Product Engineer** role and how my skills and background made me a good fit.
- I was asked to provide real-life examples from my academic or project experience to justify my suitability.

ROUND 3 – behavioural Interview

- More emphasis was given to communication skills, clarity in expressing my ideas.
- Again, the focus was on “**Why Product Engineer?**” and “**How do you suit this role?**”.

PREPARATION STRATEGY:

- Built my fundamentals in **DSA** using GeeksforGeeks and LeetCode.
- Practiced **problem-solving daily**, covering topics like arrays, strings, linked lists, trees, graphs, searching, and sorting.
- Revised **DBMS, OOPS, and OS** concepts in depth.
- Prepared a **detailed explanation** and **diagrams** for my projects so I could explain them clearly during interviews.
- Practiced **behavioural interview questions** to answer confidently and with relevant examples.

Useful Links:

- **Coding:** [NeetCode](#), [Striver's SDE Sheet](#)
- **DBMS:** [JavaTpoint DBMS](#), [InterviewBit DBMS](#)
- **OS & OOPS:** GFG OS Questions
- **Aptitude:** [Indiabix](#)

TIPS:

- Be very clear about your **projects** — both technically and architecturally.
- Answer behavioural questions with real-life examples, not just theory.
- Don't panic if a question seems tricky — explain your approach step-by-step.

- Always have questions prepared for the interviewer (about role responsibilities, project domains, work culture).
- Stay confident and show enthusiasm for the role.

Suggestions:

- Start preparing at least before your internships in the 3rd year.
- Importantly, take the internships seriously and aim to get selected. That makes you feel less burden in the 7th semester. Even if you don't get selected, the preparation will definitely help you.
- Only include what you know in your resume.
- Believe in yourself.. Don't ever lose hope and Always be confident!
