

# My Interview Experience

## Round 1(BNY): Online Coding

My first round of coding was an online test for BNY. We had 4 questions that we had to finish within around 60 to 90 mins. The questions were in ascending order in terms of difficulty. The topics in these questions included algorithms whose prior knowledge is key to solving. Arrays, Strings and Dynamic Programming questions. The questions were tough ones. The selection was done even if the candidate had not solved all 4 questions. So the more you solve the better chances and keep an eye out to solve as many test cases as possible. Sorry although I do not remember the questions exactly.

## On-Campus Interview (BNY):

The whole process consisted a total of 3 rounds. Many interviewers had shown up and the questions put out by them are different, based on the interviewer alone, so the difficulty may vary for sure.

So, in my first round I was asked about my personal projects mentioned in my resume. Most of my projects were full-stack hence I was asked about my interests as well, like why web-development or what about other technologies currently trending and so on. I was asked questions based on React and concepts around it. I was also asked in what ways can one map OOPs concepts that I had studied in C++ to concepts in React.

There were questions about my projects, about the workflow and why I had used a particular concept. So be thorough with the projects mentioned in your resume. There is also a high chance companies ask you to draw ER diagrams for your projects and question about it. The majority of this round was about projects, concepts like threads, OOPs & SQL. I was also asked about projects in other domains like Machine Learning. I was also asked my work outside of college projects, extracurricular activities if any and projects that were not part of college syllabus.

The next round was a little more lightweighted on the technical side and had a few more HR related questions as to why BNY? Why fintech? Why not a Product based company? What do I know about BNY? And so on. The technical

aspect was again few generic questions about C++ & SQL. Some questions about my projects and Domain interests.

My last round was with a Director from BNY. I was again asked about my projects and explain one of them and their use-case. He later gave me a scenario as follows:

“A busy man needs to pay his maid, cash only. He goes to a nearby ATM only to find out that cash is not available in the ATM. How would improve his experience as a customer, give 3 possible solutions to enhance customer satisfaction.”

So that was my interview experience in total.

## **Other Interview Experiences:**

I have 2 other experiences. One for my summer internship with SCB and another during placements with Appian.

So SCB was more of projects and SQL based. Lot of why fintech and SCB questions as well. ER diagrams and more database related questions based on Joins, Create, Update and other concepts if you have used in your projects.

Appian was actually looking for proper java developers. Although they did allow us to code in c++ but from scratch and not pre-defined testcase type questions how one would solve in leetcode. So added difficulty. They asked a lot of Dynamic Programming and Tree based questions.

## **Some Useful tips perhaps:**

There will be a lot of technical, resume and HR related questions, make sure to be clear, honest and speak confidently with the knowledge you have in a very respectful manner.

Do Strivers crash sheet incase you are only starting with your coding, watch videos and try to grasp concepts. Do not spend excess time if you are not able to solve a particular problem. Tensions will be high alongside huge peer pressure when friends and fellow classmates get placed. Try to be optimistic and practice as hard as you can and give full effort. Refer NeetCode sheet as well, that can be helpful. So practice well, keep basic coding syntax and knowledge in mind.

Go through Concepts like Networks, OOPs, Threads and more which are the theoretical concepts in your syllabus. Focus more on interview websites that have pre-defined questions, helps in covering topics quicker.

Know time complexity of various searching and sorting algorithms. Keep the coding strong, practice and cover as much as DSA as possible.

Hope my experience and tips/advice can help y'all. Stay calm, have faith and do well and work hard.

ALL THE BEST!!
