

Agilan B - Information Science and Technology

Summer intern Analyst(Former) and Full-Time Employee

CITI CSIPL ICG O&T

About the company:

Citi Solutions Center (CSC) is a global hub for innovation and operations within Citigroup, providing comprehensive solutions and support across various functions like technology, operations, finance, and risk management.

About the role:

Citi's Institutional Clients Group Operations and Technology (ICG O&T) creates cutting-edge technology solutions and is dedicated to delivering outstanding service to our clients, working closely with our product teams. Our ICG O&T team is made up of diverse and inclusive professionals across nearly 90 countries worldwide.

Overview of the Selection process:

The selection process included

1. Online aptitude and coding contest
2. Technical interview - Round 1
3. HR - Final Round

Domains offered:

Although the specific roles were not explicitly mentioned, the candidates who got selected in Round 1 were divided into two groups for offline interviews.

1. Institutional Clients Group
2. Enterprise Operations and Technology

Online aptitude and coding contest:

The coding contest was conducted on the SHL platform. It included 5 sections.

1. Aptitude
2. Logical Reasoning
3. Verbal Ability
4. Technical

5. Coding contest

Each section had a set time limit, and the next section could only be accessed after completing the previous one. Each section had a time limit of approximately 20 minutes with MCQs except the coding contest which had a time limit of 1 hour.

Questions asked in Coding contest:

1. Trapezium Pattern Printing
2. Determine the maximum number of times you would need to call a special function, which generates a unique permutation of an array each time, in order to obtain a permutation that is sorted in ascending order

Offline Interview:

A total of two rounds - Technical and HR - were held in offline mode at CUIC.

Technical Interview:

The interview panel, consisting of two members from Citi's ICG Tech Business Unit, began by asking questions related to my resume. We first discussed my skills, with a particular focus on my knowledge of the Java programming language. Since I was currently studying Object-Oriented Programming in Java, I mentioned that I was new to Java but had experience with C++. They also inquired about my understanding of Computer Networks which I was studying at the time.

Next, we discussed the projects listed on my resume. One notable project was a quiz website I developed for ISTA 2022, where I primarily worked on the backend and database. This aspect of the project left a positive impression on the interviewers. They briefly reviewed the other projects as well.

Following this, they provided me with a sequence of numbers and asked me to insert them into AVL and Splay trees, as well as to perform deletions of certain numbers. Subsequently, they presented a scenario involving airways and requested that I create tables for it and draw an ER diagram.

In the data structures portion, they presented a scenario involving a train with various compartments, where General and AC compartments are connected sequentially. They asked me to insert a Catering compartment between these compartments and to specify which data structure would be appropriate for this setup. I proposed a solution using Linked List and provided a pseudocode for the requirement. This round lasted approximately 45 minutes.

HR Round:

After being selected in the Technical round, I, along with three other candidates, was assigned to a final round with an HR panel. I was the first to meet with the HR in that panel. The HR was very friendly, and we began with a brief introduction, discussing my interests and hobbies. I was asked about my interest in pursuing a Master's, to which I responded negatively. We also talked about Bollywood and Hollywood, exchanging opinions on their film industries. The interview concluded with a brief overview of my family. This round lasted around 10 minutes.
