

INTERN DRIVE EXPERIENCE – FIDELITY INVESTMENTS

-Abharna Shree M

About the Company

Fidelity Investments is a leading multinational financial services corporation that provides a wide range of investment management, retirement planning, wealth management, brokerage, and financial advisory services. Founded in 1946 and headquartered in Boston, Massachusetts, Fidelity is one of the largest asset managers in the world. Fidelity is known for its user-friendly trading platforms and apps that offer powerful research tools, real-time data, and educational resources. Fidelity Investments is committed to innovation, strong customer service, and comprehensive product offerings, making it a popular choice for investors of all levels.

Overview of the Process

- **Round 1: Online Assessment** (English Proficiency, Technical, Coding, Algorithm) - in Hirepro platform
- **Round 2: Technical Interview** (Resume and Technical) – at CUIC
- **Round 3: HR Interview** – at CUIC

Online Assessment in Hirepro platform

The assessment consisted of four sections on English Proficiency, Technical, Coding and Algorithm. Each of the sections were separately timed.

Section 1: The questions were based on English vocabulary such as fill in the appropriate word, synonyms, sentence rearrangement and passage comprehension.

Section 2: MCQ's on Operating Systems, Data Structures and Algorithms, Computer Networks, OOP, SQL, including code snippets and output/error analysis. There was no negative marking, yet I didn't attend all questions in this section.

Section 3: This section had 2 coding questions.

- First question was to find the extreme number by swapping the digits once (solved with brute force approach)
- The second question was to print the string of count of consecutive patterns in the input i.e. input – “%%%%\$\$%%” output - “322”

My code passed all test cases for both the questions.

Section 4: We were asked to type out two Algorithms.

- Recursion Algo for subsequence (selection/rejection)
- Infix to prefix conversion with stack

As I spent more time on the first algo, I couldn't complete the second one within the time limit.

54 students were shortlisted for the offline interview.

Technical Interview

There were several panels for this round and the questions and the duration varied depending on the panel. On a general note, the focus was on discussing projects from the resume and technical questions related to CS fundamentals. My interview lasted for about 40-45 minutes.

- The interviewer introduced himself and asked me to introduce myself.
- He asked me to explain one of my projects on my resume.
- He asked if I had studied OS as part of my coursework and questioned about kernel in OS.
- What is inheritance and abstraction in OOPs.
- I was given two tables and asked to write a simple SQL query (join) for the specified result.
- He noticed that I had hosted a website in Render from my resume and I offered to show it on my phone. He was interested and waited till I came back.
- I was asked if I had knowledge of cloud storage. Though I had anticipated the question, I mentioned that I had only a basic understanding, and he then asked to name a few cloud service providers.
- He asked about my hobbies and other co-curricular activities mentioned in my resume.
- I asked about his journey at Fidelity and how will my day at fidelity be, when offered an internship.

The questions were basic and I was able to answer all of them.

25-30 students were shortlisted for the HR round.

HR Interview

The interview lasted about 15-20 minutes.

- Introduction
- What are your strengths
- Since I mentioned being a team player in my previous answer, the interviewer asked if I see myself as a leader or a member of a team.

- What differentiates a leader from other team members
- General conversation about day scholar College life.
- Again, I asked about her experience at Fidelity and her journey with the company.

12 of us were offered the internship.

Tips and Tricks

- Go through previous years' intern interview experiences from online platforms and seniors. I prepared topics like cloud storage and data mining, apart from regular CS fundamentals, after reading experiences on platforms like Geeks for Geeks.
- Dress up in formal decent attire for the interview to make a good first impression.
- The HR interviewer greeted each interviewee with a handshake, make sure to give a confident handshake as it reflects your personality
- Ask peers who have their interviews before you about their experience to get an idea of the questions. There are chances you might get a similar question.
- Do not mention anything you are not confident about in your resume.
- Communication skills are of great importance. How you present what you know is equally important to what you know!

My Preparation Journey

- I started to solve the weekly practice questions released from ACM CODE and I attended most weekly contests in 4th semester holidays. I

managed to solve all easy and just more than half of medium-level questions in most topics.

- I tried to solved 4 to 6 questions every day for about two weeks. While I couldn't maintain my daily streak every day, I remained consistent. I would have no idea on a question, after 10 minutes of trying to figure it out on my own, I got YouTube help. I couldn't wrap my head around some algorithms on the first attempt, so I set a time limit of one hour per question. Even if I didn't understand the solution completely, I would move to the next question. I couldn't cover all topics I had initially planned as I had to work on my summer project as well.
- Also, Preparation and experience of previous company interviews came in handy.
