Preparation strategy/tips and tricks:

Pretty much what you'd do for any data analytics interview, do coding problems (methods maybe). The company prefers people who have an ai or data science course certificate. Make sure you know atleast the basics of sql and excel as well

Placement drive experience:

Online test- was pretty easy but you might want to be truthful with the generic questions and technical questions are pretty easy if you follow prep strategy from above.

GD- talk. Try to talk whenever you get a chance. Does not mean you should interrupt others when they are talking. Be cordial. Just generic gd stuff

Technical interview: Try to keep it a conversation. Ask questions, doesn't matter how trivial, that gives them an impression on your impression.

HR interview: again, ask questions. When asked about your preferences, don't be scared to voice out your opinions. They are usually open to suggestions
