

JEYABALAN P - SOFTWARE INTERN @ NCR VOYIX

jeyabalan764@gmail.com || www.linkedin.com/in/jeyanth-p

About the Company:

NCR Voyix (operating in India through Terafina Software Solutions Pvt. Ltd.) is a global technology company that powers everyday consumer transactions across industries such as banking, retail, hospitality, and financial services. With a presence in over 35 countries, the company delivers innovative software platforms, cloud solutions, and digital transformation services that help enterprises create seamless and secure customer experiences.

NCR Voyix's solutions are widely used for self-service systems, payment processing, and enterprise software, supporting millions of interactions worldwide. The company emphasizes cutting-edge engineering, global collaboration, and delivering technology that simplifies and enhances consumer interactions.

About the Role (Software Intern):

I have been selected for a Software Intern position at NCR Voyix, where the internship includes a structured 6-month training period. During this time, I will be working under the guidance of senior engineers to gain hands-on experience in software development, debugging, testing, and understanding enterprise-level workflows.

This internship is performance-based, meaning that full-time employment is not guaranteed but may be considered depending on my performance during the training period. The role provides exposure to real-world projects, modern technologies, and professional development practices, allowing me to build industry-ready skills within a global product-based company.

Overview of the selection process:

Our Online Assessment And Interviews all happened at CUIC . We had four rounds:

- 1) Online coding round in Hackerank (40 Got shortlisted)
- 2) Technical Interview (20 got shortlisted)
- 3) Managerial Interview (10 got shortlisted)
- 4) HR Interview (All 10 were selected for the internship)

Round 1 : Online coding round:

[1 hr]

The online coding test was conducted at CUIIC through the HackerRank platform. We were given two coding problems—one easy and one hard. The harder problem was challenging for most candidates, so it's completely normal even if you couldn't solve it fully.

Question 1:

Link: <https://leetcode.com/discuss/post/7366207/atlassian-question-how-to-solve-this-by-rjuji/>

Tip: I initially attempted a graph-traversal + factorial-based approach, which gives the correct logic but exceeds the time limit due to constraints. The optimal solution involves using combinatorics, which is more efficient and runs in roughly $O(n \log n)$ time.

Question 2:

You are given a set of points on a Cartesian plane. These points collectively form multiple squares, and in a few squares one point is missing. The task is to find and return the missing point for incomplete squares.

Tip: This can be solved cleanly using an XOR-based method or by using set operations to identify the missing coordinate.

Round 2 : Technical Interview(Offline):

[1 hr]

I had a panel of two interviewers. The discussion began with my self-introduction, after which I walked them through a few of my projects. They were genuinely interested, and I explained one of the projects in depth. Most of the questions at this stage were focused on the work I had done, the technical decisions I had taken, and the outcomes.

Next, the interview moved into DSA. They referred to the online assessment questions, and I was asked to pick one and explain it. I chose the hard problem, described my initial approach, clearly justified why it failed due to time complexity, and then walked them through the optimal approach. They also asked for the time complexity, and I explained that along with writing the pseudo-code on paper.

There was a whiteboard with partially erased Python code written on it. I was asked to interpret the code and explain what it might be doing. The twist was that even they did not know the original code (it was pre-written); the intention was simply to test how I approach an unfamiliar or incomplete task.

Next came a system/design question: "Consider you are designing a WhatsApp-like application. Design the database."

I identified the stakeholders, listed the entities, and drew an ER diagram. They further asked how the user messages table would look, so I designed the schema, taking into account both user-to-user and user-to-group messaging. I ensured my design satisfied 3NF.

We also briefly discussed end-to-end encryption and how messages remain secure. This led to a conversation on JWT, which I explained in detail.

Round 3 : Managerial Round(Offline)

[45min]

The managerial round was informal and conversational, mainly focused on understanding my motivation and cultural fit. I was asked questions such as why I chose NCR Voyix, what I liked about the company, and what I knew about its corporate culture. The discussion also included topics like work from home vs. work from office, plans for higher studies, family background, and a groundbreaking technology I recently came across. There was also a brief conversation about toxic workplace culture—what I think contributes to it, how to avoid it, and how I would handle such situations professionally. Overall, the round assessed my communication skills, mindset, and ability to work well in a healthy team environment. (I may not remember every question, but these were the key themes.)

Round 4 : HR Interview(Offline)

[10min]

Around ten candidates were shortlisted for the HR round. The interview was brief and focused on basic HR-oriented questions such as why I chose NCR Voyix, my family background, and my willingness to relocate or work from cities like Bengaluru or Chennai. This was the quickest round of the day, and all ten candidates were selected. The entire recruitment process started at around 8:30 AM and went on until 11:00 PM, making it one of the longest interview days ever conducted at CUIC.

Preparation Strategy:

For DSA, I mainly followed Striver's SDE Sheet and the NeetCode 150 list. I also made it a habit to solve daily LeetCode problems and regularly participate in LeetCode contests. (I personally wouldn't recommend Codeforces for interview preparation as it is more competitive-programming-oriented and not fully aligned with typical interview patterns.)

For DBMS, I practiced the LeetCode SQL 50 problems and HackerRank SQL challenges. I focused strongly on topics like joins, subqueries, CASE/IF, window functions, normalization, and database design, as these commonly appear in interviews.

For the core CS subjects, I didn't follow separate dedicated material. Instead, I revised important concepts from Operating Systems and Computer Networks using quick summaries and explanations from ChatGPT.

On a final note, I had also attended several other interviews, including companies like Nokia and Netradyn. I genuinely gave my best in both, and those experiences taught me a lot about handling pressure, adapting to different interview styles, and staying confident even when the questions get tough. These interviews also made me realize an important truth: along with preparation and performance, a bit of luck and timing also play a role in the selection process. Every interview, whether successful or not, added to my learning, improved my thought process, and helped me handle the NCR Voyix interview with more maturity and clarity. Looking back, the entire journey shaped me far more than a single result could.
