

## Interview Experience

**Name:** YOHESHWAR S

**Reg. No:** 2018115137

**Company:** Trimble

### 1) **ONLINE TEST:** It contained 3 rounds.

#### **Round 1: Technical Aptitude (45 mins)**

This round had 11 questions which were not mcqs and they were kind of fill ups where we were supposed to type the solution or logic in the text area given or we were allowed to write the solution, scan and upload it. It contained questions from **Operating Systems, OOPS, DMBS, Data Structures, Computer Networks**. This round was conducted in **Hackerearth**.

#### **Round 2: Quantitative Aptitude (30 mins)**

This round had 5 questions. Here also we were supposed to give the complete solution with steps or we could write, scan and upload it. This round was conducted in **Hackerearth**.

#### **Round 3: Programming (1 hour 30 mins)**

This round had 3 questions. The questions were not that difficult, but maintaining the time complexity was the difficult task. I solved one question with brute force which passed me half of the test cases. But by solving the remaining questions with brute force did not pass me any of the test cases. So I opted DP even though it did not pass me all the test cases. So don't opt for brute force method even it passes half of the test cases. Go for DP. This round was conducted in **Hackerearth**.

After these three rounds, 13 students were shortlisted for the interviews.

### 2) **INTERVIEWS:**

#### **Round 4: Technical Interview (2 hours):**

There were two interviewers. First I was asked to introduce myself. Then they shared a document which had a question on **multilevel queue scheduling**, which I solved in Round 1 (technical aptitude).

They asked me how did I solve that question. I explained the logic and the order in which the processes would be scheduled. Then I was asked to solve three questions.

- Construct a **linked list** from scratch and find the sum of two numbers represented in linked list.
- Construct a **binary tree** from scratch and find the sum of numbers in each vertical order of a binary tree.
- **Graph:** Given a 2d matrix, a source and a destination. Find the shortest path between source and destination. I solved this question using **breadth first search (bfs)**.

I was asked with the time complexity, space complexity and better approach for each and every question.

### **Round 5: Technical Interview (1 hour 30 mins):**

In this round there was only one interviewer. First I was asked to introduce myself. And then he started with one of the projects which is a 3d game done using unity and asked me to explain it. I was asked many scenario based questions within the project itself, like “What difficulties would I face when that game was a multiplayer game and if it was controlled by a same server?” and etc . Then he asked me about **Raycasting** in detail. And he gave me a scenario and asked me to arrive with the data structure which would suite that scenario and he asked me to **design a security system**. Then he asked me some scenario based questions and some HR questions about my family.

### **Round 6: HR Interview (15 mins):**

Here there was only one interviewer. He asked me to introduce myself. And then he asked about my family, my financial status, my interest on higher studies and then he started speaking about the job description, salary package and benefits.

**Finally four students were given FTE.**

### **NOTE:**

- Be casual and friendly to the interviewers. Don't get tensed at any point of time. Be thorough with all the data structures and all your projects.
