

Wells Fargo Placement Experience

- **Rishi Kumar U (2022115085)**

- **Batch [2022 - 2026]**

About the Company

Wells Fargo & Company is a diversified, community-based financial services company with **\$2.0 trillion in assets**. Founded in 1852 and headquartered in San Francisco, Wells Fargo provides a wide range of services including banking, insurance, investments, mortgage, and consumer/commercial finance.

The company operates through more than 8,500 locations, 13,000 ATMs, online banking (wellsfargo.com), and mobile platforms. With a global presence in 42 countries, Wells Fargo supports customers who conduct business in the global economy. The company employs approximately 273,000 team members and serves one in three households in the United States. Wells Fargo's vision is to satisfy its customers' financial needs and help them succeed financially.

About the Role: Enterprise Global Services (EGS)

The role is part of the **Enterprise Global Services (EGS)** technology team. EGS is a crucial division that enables global talent capabilities for Wells Fargo. It supports over half of the company's business lines and staff functions across four key areas: **Technology, Business Services, Risk Services, and Knowledge Services**. EGS operates from locations in Hyderabad, Bengaluru, and Chennai in India, as well as Manila in the Philippines.

As a member of the team, you interact closely with multiple business and technology partners across various Wells Fargo locations, contributing to a diverse and inclusive organizational culture.

Preparation Strategy

- **Data Structures & Algorithms (DSA):** The online test included a medium-hard dynamic programming problem. While the interview DSA question was basic (Height of a Binary Tree), a strong foundation is essential to clear the initial screening. Practice consistently on platforms like HackerRank or LeetCode.
- **Core CS Fundamentals:** This is non-negotiable. Interviewers repeatedly tested concepts from **OOPS, DBMS, Operating Systems, and Computer Networks**. Ensure you have a deep and clear understanding of the fundamentals.

- **Full-Stack Development:** The technical interviews heavily emphasized my development projects. Be prepared to discuss your tech stack (**React, Node.js, Express**), backend design, database schema, security policies, and API design in detail.
- **SQL:** The online test featured a dedicated SQL question, and database concepts were discussed in interviews. You must be comfortable writing complex queries involving joins, sub queries and aggregate functions.
- **Software Development Life Cycle (SDLC):** This topic was brought up in every single interview round. It's critical to understand the different phases of SDLC and be able to explain how you applied them to your projects.
- **Resume Deep Dive:** Be prepared to explain every single line on your resume. Interviewers will ask follow-up questions about your projects, internships, hackathons, and skills. **Know your story and your work!**

Placement Drive Experience

The entire process consisted of four rounds conducted sequentially.

Round 1: Online Test (HackerRank)

This round was purely focused on coding and problem-solving, deviating from the previous pattern of including aptitude questions.

The test consisted of three problems:

1. **Regex:** Write a regular expression to find all words where the **starting and ending letters are the same**.
2. **Dynamic Programming (The Taxi Driver Problem):**
A taxi driver receives ride requests, each with a pickup, drop, and tip. The earning for a ride is calculated as:
$$\text{earning} = (\text{drop}[i] - \text{pickup}[i]) + \text{tip}[i]$$

The driver can only accept non-overlapping rides (a new ride's pickup time must be greater than or equal to the previous ride's drop time). Given the three arrays, find the maximum possible earnings.
3. **SQL Query:**
Write a query to find the total usage time (in seconds) for each task. The usage time is the sum of the differences between `end_dt` and `start_dt` for all its associated processes. Return each task's hash and its total usage time, ordered descending by the usage time.

Round 2: Virtual Technical Interview

(Duration: 50-55 minutes)

This interview was conducted by Varadan S - a developer who was very approachable. After a brief self-introduction, he asked follow-up questions on my intro about the hackathons and project expos I mentioned.

The interview then progressed as follows:

- **Resume Deep Dive:** He systematically went through my resume, focusing heavily on the development side.
- **Technology Stack:**
 - **Frontend:** In-depth questions on **React**.
 - **Backend:** Questions on **Node.js**, **Express**, backend design structures, security policies, etc.
 - **Database:** Questions on **DB design** and **writing SQL queries**.
- **SDLC:** He asked how I incorporated SDLC methodologies in my hackathon and personal projects. The questions ranged from easy to difficult, designed to gauge the depth of my knowledge.
- **DSA Check:** He asked a simple question: "Find the height of a binary tree," and asked a few follow up questions on Trees primarily to check my basic coding fundamentals.
- Comparison of different **data structures** and their **search complexities**.
- **Core Subjects:** Covered the basics of **OOPS**, **DBMS**, **OS**, and **Networks**.
- Explain OOPs concepts with simple real world examples rather than technical definitions.
- **Project Discussion:** A very detailed discussion about my internship and projects. He was keen on understanding my specific contributions and assessing my teamwork and collaboration skills.
- **Behavioral Question:** The final question was, "**What are the major new challenges that you faced in the development of a project?**" He specifically asked me to take my time to structure a good answer. I explained a challenge and connected my solution to the SDLC framework, which he appreciated.

I concluded by asking him about his experience transitioning from college to a corporate role. Out of 25 students, around 14-16 were shortlisted for the next round.

Round 3: In-person Technical Interview

(Duration: 40-45 minutes)

This round was even more conversational. The interviewer skipped the self-introduction and started by asking about my academic journey and curriculum.

- **My academic journey and curriculum:** From how I entered CEG to Courses learnt.
- **Favorite Subject Deep Dive:** He asked about my favorite subject. I said **Computer Networks**, which set the direction for the next 15-20 minutes. I explained everything I knew, and he listened with interest before asking follow-up questions on topics like **TLDs**, **SSL**, **network security**, **IPv6**, and **Private Networks**.
- **Favorite Language Deep Dive:** He asked for my favorite programming language and then tested my knowledge from basic to advanced **OOPS concepts** within that language.
- **Project Discussion:** He asked me to pick two projects from my resume and explain them in detail. The focus was on potential improvements and the application of **SDLC**.
- **Agentic AI:** While discussing ML and DL topics during the interview, he started asking about Agentic AI.

- **Random CS Fundamentals:** He asked several questions on various CS topics to ensure my fundamentals were strong across the board.
- **Hobbies & Personality:** He noticed 'Photography' listed as a hobby on my resume and asked about it, including technical aspects like the "rule of thirds." This was a great way for him to gauge my personality and passion outside of work.

This interview felt like a friendly, technical conversation. Around 8 students, including myself, were moved to the final round.

Round 4: Techno-Managerial Interview

(Duration: 15-20 minutes)

This was a final, brief round to assess my overall fit.

- It began with a self-introduction.
 - He asked some basic questions on **OOPS and DSA**.
 - The main focus was on my **projects and the competitions I had won**. I selected a key project and explained its architecture, challenges, and outcomes in detail.
 - Projects and the knowledge you possess on the topics of the projects is very important.
 - He completed by asking a few questions on **AI, Agentic AI, ML, DL** etc.
 - It ended with me asking a few questions to the interviewer about how the company is transforming due to the growth of AI.
-

Tips and Tricks

- **Honesty is the Best Policy:** During my first interview, the interviewer was trying to assess how honest I was with my answers. Don't bluff. If you don't know something, it's better to admit it.
- **Know Your Resume:** This cannot be stressed enough. Every single word on your resume is fair game for a deep-dive question. Be prepared to defend and elaborate on everything you've written.
- **Master the Fundamentals:** Wells Fargo places a high value on strong core CS concepts. Don't just focus on DSA; revise OOPS, DBMS, OS, and Networks thoroughly.
- **Connect Projects to SDLC:** Simply building a project is not enough. Be ready to explain *how* you built it using principles from the Software Development Life Cycle. This shows maturity and a professional mindset.
- **Be Communicative and Confident:** The interviewers were chill and appreciated a conversational style. Don't just give one-word answers. Explain your thought process clearly and confidently.
- **Ask Insightful Questions:** Prepare a few good questions to ask your interviewers. This shows your interest in the role and the company.

Recommended Preparation Resources

- **DSA:** Striver's SDE Sheet, LeetCode (Easy/Medium), HackerRank (Problem Solving).
 - **Core Subjects:** GeeksforGeeks articles for all core subjects (OS, DBMS, CN), and refer to standard university textbooks for deep conceptual clarity.
 - **SQL:** Leetcode's SQL 50 is excellent for practice.
 - **Web Development:** Official documentation for React, Node.js, and other frameworks you have used. Building and deploying a full-stack project is the best preparation.
