

BNY MELLON TECHNOLOGY(INTERNSHIP)

ABOUT THE COMPANY

BNY Mellon Technology Private Limited, established in 2000, is a group company of BNY Mellon operating in India, providing technology solutions to the bank.

SELECTION PROCESS

ONLINE TEST (CODING)

There was an online test with 4 coding questions. They were categorized as easy, medium and hard. There were 2 medium questions and 1 each from easy and hard categories. The easy question had a straight forward solution but involved large numbers. So a simple solution in Python was accepted. Languages like C, C++ would have made the solution a little complex. One of the medium questions was an array manipulation question and the other question was based on graphs. The hard question was a Dynamic Programming question. Candidates who solved the easy question and atleast one medium question completely were shortlisted for the interview process.

TECHNICAL INTERVIEWS (3 ROUNDS)

The interview process had three rounds in total. In the first round, the interviewer asked us to introduce ourselves and then tested my understanding of fundamental data structures and their related concepts. Also the concepts of pointers were discussed in detail. The interviewer also asked me to write and explain some algorithms like the quick sort algorithm. Based on the performance in the first round, the candidates were shortlisted for the next round. In the second round of the interview, I was asked to write down code snippets for three coding questions. All questions were based on string manipulations and I was specifically asked to give recursive solutions. Candidates were then shortlisted to round 3 of the interview process. In round 3, I was asked about any extra project that I worked on apart from that required by the academic curriculum. I talked about a cricket simulator program that I wrote in C++ and there were further questions about the project. The final list of selected candidates was shared with us on the next day.

INTERNSHIP EXPERIENCE

The summer internship was held virtually from May 2020 to July 2020. After two weeks of general and technical training, we were assigned to separate teams. We were also assigned individual mentors whom we could reach out to, at any time. I was given an Angular migration project in which I worked on migrating a web application from Angular JS to Angular. The overall experience was very pleasant and enriching.

FOCUS ON: Data structures fundamentals, basic algorithms and problem solving

ALL THE BEST!
