

Fidelity Investments

About the company:

Fidelity Investments is a leading multinational financial services corporation headquartered in Boston, Massachusetts, USA. Founded in 1946, the company provides a wide range of services including investment management, retirement planning, brokerage, wealth management, and financial advisory solutions. Fidelity is one of the largest asset managers in the world, serving millions of individual investors, financial advisors, and institutions.

Number of rounds:

1. Online Test
2. Technical Round
3. HR Round

About the rounds:

Round 1: Online Test

The online assessment was conducted on the **HirePro** Platform and lasted for about 1 hour and 30 minutes. It consisted of 3 sections, each with a time limit.

1. The first section consisted of questions from **English Language and Verbal Ability**, including Sentence Arrangement, Fill in the Blanks, etc.
2. The second section consisted of **Technical Aptitude** questions from core CS fundamentals such as **DSA** (Sorting, Graphs, Heaps), **DBMS** (SQL queries), **OOPs**, **Networking**, and output-based code questions. It also included questions related to **Prompt Engineering** and **Generative AI** (basic level). The difficulty ranged from easy to medium.
3. The third section consisted of two coding questions, both of easy-level difficulty.
4. A total of **75 students** were shortlisted for the next round.

Problem 1: String Rearrangement

Description:

You are given a string of uppercase alphabets. Each character in the string needs to be rearranged according to the following pattern:

- Characters at even positions should be shifted backward by 1 in the alphabet (Z→A).
- Characters at odd positions should be shifted forward by 2 in the alphabet (Z → B).

The task is to apply this transformation to all characters and print the new string.

Example:

Input : SPLURGE

Output: RRKWQID

Problem 2: Reward Score for Customer IDs

Description:

Given two ID's(numbers) you have to find the sum of the digits individually for the two numbers and then return their product.

Example:

Input : 123 456

Output: 90

Explanation:

- Sum of digits of 123 = $1 + 2 + 3 = 6$
- Sum of digits of 456 = $4 + 5 + 6 = 15$
- Final score = $6 \times 15 = 90$

Round 2: Technical Interview

The technical interview was conducted at CUIC at 9:00 AM. The session began with a brief introduction about the company.

Unlike most interviews, the interviewer did not ask me to introduce myself. Instead, he directly referred to my resume and asked me to explain my favourite project. After my explanation, he asked a few follow-up questions related to the project.

He then asked, "*What do you know about Fidelity?*" Since I had done prior research about the company, I was able to answer confidently. Preparing for such questions can positively impact your score.

Next, he asked me to explain a sorting algorithm of my choice. I chose **Merge Sort** and demonstrated the step-by-step process on paper.

Following that, he asked which data structures I like. I mentioned **Vector** and **Linked List**, and explained their pros, cons, and real-world applications. He then moved on to **Non-linear Data Structures**, where I explained **Graphs** and **Trees** along with their practical use cases—such as file systems (Trees) and maps/navigation systems (Graphs).

He also asked whether I preferred working in a team, to which I responded positively.

Towards the end, he gave me the opportunity to ask questions. I asked:

- "Could you share your experience at Fidelity?"
- "What do you like the most about working here?"
- "What kind of projects will interns get to work on at Fidelity?"

The interviewer was very friendly and patiently listened to my answers. The discussion was highly interactive, and I felt comfortable throughout.

The round lasted for about **30 minutes**. One important takeaway is: *never hesitate to ask the interviewer relevant questions, as it reflects your interest and curiosity.*

Round 3: HR Interview

The HR interview began with a self-introduction, followed by a few personal questions about my family and native place.

The interviewer then asked me about **Fidelity**, to which I responded confidently based on my prior research. After that, he inquired about my **projects**.

One of the key questions was: *“Why should we hire you? We can use AI to develop applications.”* I explained that while AI can indeed assist in building basic applications, a developer’s role is crucial for ensuring productivity, handling complex requirements, and maintaining applications in case of issues. AI can enhance efficiency, but it cannot replace the need for skilled developers.

He then asked me about my **strengths**. Another interesting question was: *“Since AI itself can do some development tasks, what will you do in the future if your job gets replaced by AI?”*

I answered that I would adapt by shifting my focus towards building applications that leverage and automate tasks using AI.

Towards the end, he asked if I had any questions. I asked:

- “How is the work-life balance at Fidelity?”
- “What is the working mode for interns—hybrid or in-person?”

The HR interview lasted for **15–20 minutes**. Afterward, around **25 to 30 students** awaited the results.

Finally, **12 students were selected for the internship**, and I was delighted to be one among them.

Key points to note:

1. Clearly and calmly articulate your thought process during the interview.
2. Strengthen CS Fundamentals – Be well-prepared in OOPs and DBMS, and also cover topics from Operating Systems and Computer Networks.
3. Know Your Projects Thoroughly – Be ready to explain your projects end-to-end, as most technical questions are often based on them.
4. Focus on One Programming Language – Master one language and practice problem-solving consistently on platforms like LeetCode, CodeChef, or HackerRank.
5. Research the Company – Understand the company’s background and prepare meaningful questions to ask the interviewer.
6. Keep the Discussion Interactive – Avoid one-line answers. Engage in a two-way conversation.

ALL THE BEST!
