

APPIAN INTERVIEW EXPERIENCE

Appian Corporation is an American cloud computing and enterprise software company headquartered in McLean, Virginia, part of the Dulles Technology Corridor. The company sells a platform as a service (PaaS) for building enterprise software applications. It is focused on low-code development, process mining, business process management, and case management markets in North America, Europe, the Middle East, and Southeast Asia. Appian offers a low-code platform with a visual interface and pre-built development modules. As with other low-code platforms, it enables businesses to create apps and automations using little or no code.

There were four rounds of interviews.

1. Coding round

2. Technical Round 1

3. Technical Round 2

4. HR round

Coding Round:

Candidates were sent a link to attend the online coding round, which was held on the Glider platform. We had to solve three questions in an hour.

Qn1:

There is a line consisting of people from different groups. We need to rearrange the line so that people from the same group can stand together. If all the persons who belong to the same group stand in line, then the names of the persons can be replaced with the group name. The order of the groups in the line and the order of persons within the group in the line should not change.

Qn2:

Tickets are sold to a concert in a particular order. The number of tickets, the step size, and the offset will be given.

Number of Tickets: This is the total count of tickets available for the concert.

Step Size: This is the number of tickets to skip before selecting the next ticket. For example, if the step size is 3, every fourth ticket will be chosen. (It can also be a negative number.)

Offset: This is the starting position from which the ticket selection begins. It can be thought of as the initial position in the sequence of tickets where the process starts.

The challenge is to generate a sequence of ticket numbers based on these parameters, reflecting the order in which tickets are sold.

Qn3:

You will be given a set of paths where each path consists of a set of strings representing a path to a particular page starting from the 'Main' (homepage) element. You need to construct a tree representing every path given as input. The root node will be the 'Main' element (Breadcrumbs problem).

Focus on your problem-solving approach to provide an optimal solution.

22 of us got selected for the next round.

Technical Round 1:

I was asked to code on the Glider platform again (pair programming interview). I need to find the Fibonacci numbers from a stream of numbers. My interviewer helped me optimize the code. I was also asked to explain the logic to him. Later, he asked me about my projects, the difficulties I faced in building them, and the way I solved those problems. At last, he asked me if I had any questions to ask him. This round mainly focused on my problem-solving skills.

Technical Round 2:

This round revolved primarily around my resume. I was asked about the subjects that I like. Since I expressed my interest in DSA, the interviewer asked me about the data structures that I have worked with and also asked me about how to choose the right data structure for a problem. I was asked about asymptotic notations, and he wanted to find the worst-case time complexity of quick sort. He asked me whether I had taken part in any coding contests (CP contests). At last, he also gave me a chance to ask him a question. I was asked technical questions in this round, which weren't too tough to answer. Just brushing through the DSA concepts that we have learnt in our earlier semesters is enough.

HR Round:

Even in this round, I was asked a few technical questions related to DBMS. I was asked about the many-to-many relation and the number of tables required to 1on RDBMS. I was asked personal background questions. Even in this round, I was given a chance to ask the interviewer a question. Make sure that your question is impressive.

Finally, 5 of us (4 of us from CEG and 1 from MIT) got selected for the position of Software Engineer Intern.

Key takeaways

1. Try to provide optimal solutions
2. Time management (you need to code for 3 problems in an hour)
3. Focus on DSA
4. Answer the questions confidently
5. Questions are based on what you have provided in the resume. So have a clear understanding of concepts mentioned in your resume.
6. CGPA plays a crucial role here. Try to maintain a CGPA of 8.5 and above.

Hope this helps

All the best
