

Visa Inc. (For internship)

Visa Inc. is an American multinational financial services corporation headquartered in Foster City, California, United States. It facilitates electronic funds transfers throughout the world, most commonly through Visa-branded credit cards, debit cards and prepaid cards.

There were two rounds for internship. The first round (coding round) consisted of four classical algorithm application questions. The second round was a technical round in which HR questions were also asked.

Coding round:

I only remember the topics of three questions.

1. Palindrome partitioning
2. A greedy approach question
3. Knapsack problem

Technical and HR round:

1. Explain how to optimize a database table such that data retrieval can be done efficiently. Database indexing is a possible answer. Explained about DB indexes and how they work.
2. When a query is executed, explain what happens. Explained the general overview of query processing.
3. Write a query to select the second highest mark in a student mark table.
4. Design a weather app.
5. Explain how blockchains work and why they are used? Explain the improvements you made. I was asked this question since I mentioned it in my resume.

General HR questions like strength/weakness were asked.

Topics to be focussed:

- Data structures
- Database management systems
- Operating system
- Whatever you mention in your resume.

Take away:

Having a good knowledge of CS basics and coding will help to get placed in this company. Be clear about whatever you mention in your resume.

Hope this helps. All the Best.
